Greenland Monday, 04 June 2007
Â
We made our first leg across the North Atlantic from
Goose
Bay to Narsarsuaq. Climbing to 11000 feet and leaving the land behind you for icy water of
North Atlantic was a bit nerve wreaking, but the flight was smooth.
We were unable to establish radio communication with
Gander control, using our HF radio; however, at 11000 feet we were able to make contact them with our VHF radio.
Approaching Greenland and seeing icebergs and towering rocky coast of
Greenland is breath taking. It is truly a nature masterpiece Â
It was the most difficult landing. Due to high mountains around the airport, we had to descent from 10000 to 900 feet in 5 mile final approach and land. Runway starts perpendicular to edge of the water and we had to duck a few icebergs on final approach, before landing. You can see the runway in the picture below. This picture was taken on our final approach.

After landing and parking, we notice a little engine oil on the belly of the plane. Â We cleaned up the oil and tried to find the source, but it was hard to find where it was coming from. We will check it again tomorrow. We may be delayed a few days.

This time of the year, sun will set about 9:30 and rise aging at about 3:00 am in

Greenland. This is a difficult concept to get use to.
